The entire subject of arches has been fully treated in the author s Treatise on Arches, in which formulas for special cases and conditions are given. Considering the fact that masonry arches are constructed of materials and under conditions which are more or less uncertain in character, the use of comprehensive or rigid formulas is not necessary or warranted. Consequently the formulas and methods here presented are somewhat approximate, but quite accurate enough for the purpose for which they are intended. The greater portion of the book is taken up with the solution of examples, giving each step in detail so as to be easily followed by the undergraduate or the engineer who has not the time to review the theory of arches in a comprehensive manner. The first and second examples have been solved by a somewhat longer method than necessary. This method was used in order to show clearly the several processes and checks.
